

## Air Source Heating Toft Hill Co Durham

### Air source heat pump and Underfloor heating project

## The Granary

Northburn Solar helped in the recently converted former granary faces Toft Hill Hall, a grade II eighteenth century farmhouse and working beef farm. It has been sympathetically restored by its owners with sustainability in mind. All energy and heating is provided by an air source heat pump and the farm's own wind turbine.

This four star gold awarded property has been refurbished to a high standard with contemporary open plan kitchen /living area, two well appointed bedrooms both en suite and full wifi throughout. The building caters for both long and short term holiday breaks in some of the most unspoilt countryside the UK has to offer; ideal for families, couples or friends looking for a self catering break in the Durham Dales.

The Granary has been restored to the highest standard but has also, taking into account the setting in which it sits, been developed with committed sustainability in mind. Making your stay comfortable and relaxing is vitally important so a state of the art heating system has been installed throughout the property. This system is fed from an innovative air source heat pump which is discreetly placed at the rear of the property. This provides heat to the property throughout the year and has virtually zero when it comes to a carbon footprint.
